Lesson 12 Teacher's Key: Hearing It Happen

GDevelop - Instructor Reference Only

VIDEO GAME CREATION

What This Lesson Teaches

No new GDevelop mechanism this week - the "Play a sound" action was already fully established by Lesson 3, so this lesson is purely about adding it to the correct existing events (from Lessons 4, 6, 8, 10, 11).

Level 1 - Full Worked Solution

- sfx_hit.wav's Play-a-sound action joins the existing bullet-enemy collision event, alongside the Score and EnemiesRemaining actions already there.
- sfx_wave.wav and sfx_lose.wav are the two genuinely new sounds, added to the exact two events Lesson 11 and Lesson 8/10 already built: the advance-wave event and the lose event.
- The full-win and advance-wave events' opposite Wave conditions (from Lesson 11) are exactly what keeps sfx_win.wav and sfx_wave.wav from ever firing together - no additional guard condition is needed this week.

Why This Structure

- GDevelop's action-per-event model means adding a sound is literally just one more Action row on an event that already exists - there's no separate 'wire this up to an event' step the way code-based engines need, which makes this an unusually low-friction lesson in this engine specifically.
- Keeping every sound action on the SAME event as the state change it corresponds to (rather than a separate audio-only event checking the same conditions again) avoids duplicating condition logic and keeps the project's event count from growing unnecessarily.

Level 2 / Level 3 Talking Points

- Ask students to identify, for each of the five Play-a-sound actions, which single event it lives on and why that's the correct event (not a nearby one that looks similar).
- For students ready for a stretch: revisit the Lesson 11 optional Functions idea and discuss what a reusable PlaySound(file) function would look like here, even though GDevelop's built-in action already makes it nearly as simple as calling one.

Common Student Mistakes

- Adding a sound action to the wrong one of the two wave-related events (full-win vs. advance-wave), causing the wrong sound at the wrong moment.
- Forgetting that the full-win and advance-wave events need their opposite Wave conditions kept intact from Lesson 11 - editing one without checking the other can reopen the 'both fire at once' bug.
- Referencing a sound file name with a typo, which GDevelop silently accepts and simply plays nothing.
