How to Use This Document

This is not a one-time assignment - it's a notebook for your game that grows alongside it. You started this in Lesson 2, and this Lesson 15 update is Semester 1's final entry - your capstone is complete. Keep this document; you'll return to it at several points in Semester 2, especially before the CoOp Expo.

- There are no wrong answers this early. If you don't know yet, write your best guess - you can change it later.
- Sections marked "YOUR NOTES" are blank on purpose. Everything else is either a fill-in-the-blank or something already planned for the whole class that's included here for reference.
- Each lesson from here on, look for a "Lesson N Goals" checklist inside Levels / Structure - that's this week's specific Level 1/2/3 targets, carried over from your Handout so you don't have to copy them by hand. Check off where each one stands for you.
- Keep this file (or a printed copy) somewhere you'll find it again - you'll be asked to revisit it at several points across both semesters, especially before the Semester 1 capstone and the CoOp Expo.

The Big Picture

Genre

Examples: platformer, top-down adventure, puzzle, shooter, racing, simulation...

One-Sentence Pitch

Example: "A robot has to reach the top of a crumbling tower before it collapses."

Games it's inspired by

What games (or movies, books, etc.) gave you this idea?

Core Gameplay

By Lesson 15, your capstone is complete and presented. Fifteen weeks ago this was a blank project in an engine you'd maybe never touched; today it's a real, finished arcade game - built, polished, and shown to the class. This is the Level 3 Refined milestone from the Feature-to-Lesson Map, and the end of Semester 1's build.

Core Mechanic

What's the ONE thing the player does over and over? Everything else in your game supports this one action.

Controls

Pre-filled with your controls from Lessons 2 and 3 - update the "Still accurate?" column (or add rows) as your game grows.

Input	Action	Still accurate?
Right Arrow	Move right (from your Lesson 2 Key Press Reactor)	
Left Arrow	Move left	
Up Arrow	Move up	
Down Arrow	Move down	
Spacebar (or Up Arrow)	Shoot a projectile upward (introduced Lesson 3)	

Win Condition

How does the player succeed?

Lose Condition

How does the player fail? (Not every game needs one!)

World & Characters

Player Character

Who / what is the player controlling?

Setting / World

Where does this take place?

Other Characters, Enemies, or NPCs

Levels / Structure

Reminder - how "Level 1 / 2 / 3" works in this class:

Level	Think of it as...	What it means
Level 1 - Minimal	MVP	The smallest working version - enough to understand the idea and move on. A complete, legitimate finish.
Level 2 - Complete	Internal Alpha/Beta	All expected features present and working end-to-end. Art/polish/balance may still be missing.
Level 3 - Refined	Ready to Publish	Feature-complete, tested, and polished enough to comfortably share outside of class.

Semester 1 Capstone: Milestones Reached

This week's specific Level 1/2/3 goals - the same goals for every engine (see your Handout for exactly how to build each one in the engine you picked). Check off where each one stands for you right now; it's fine to come back and update this later.

This Lesson's Goal	Plan to Implement	Implemented	Not Planned
Level 1 MVP (Lesson 6) reached: a complete, playable loop - move, shoot, score, lives, a real win and lose state.	☐	☐	☐
Level 2 Complete (Lesson 11) reached: real depth - multiple waves, sound, and hit reactions all working together.	☐	☐	☐

This Lesson's Goal	Plan to Implement	Implemented	Not Planned
Level 3 Refined (today) reached: difficulty scaling is present, and at least a good-faith attempt at one chosen stretch feature exists. Feature-complete, tested, and polished enough to comfortably share outside of class.	☐	☐	☐

Level/Area	What happens there	Status

Visual Art Plan

Placeholder art is completely fine while you're prototyping - the lesson Assets folders always include ready-to-use placeholder sprites so you never have to stop and hunt for art mid-lesson. Use this section to describe what you eventually want your game to look like.

Art Style

Examples: pixel art, flat cartoon, simple geometric shapes, hand-drawn...

Color Palette / Mood

Placeholder assets currently in use (check any that apply)

- ☐ player_circle_blue.png / player_circle_green.png / player_circle_orange.png
- ☐ player_arrow_white.png
- ☐ player_walk_spritesheet.png
- ☐ bullet_yellow.png (introduced Lesson 3)
- ☐ enemy_invader_red.png (introduced Lesson 4)
- ☐ My own art (describe below)

Notes on your own art assets

Audio Plan

Your capstone's final sound and art assets are whatever you've built and imported across Lessons 2-14, including any polish added during Lesson 15's workshop time. This is a good place to jot a final note on what you'd improve first if you kept working on this game.

Music Style / Mood

Sound Effects Needed

List the moments in your game that should make a sound.

Scope & Milestones

This is the class's actual 30-lesson schedule (see the Course Syllabus for full detail) with a column for your own status. Use it to check whether your game is on pace with the rest of the class, not as a strict deadline - talk to your instructor if you're falling behind or racing ahead.

Lessons	Class Focus	Class Milestone	My Status
1	Orientation: internet safety, game dev overview, platform selection	Engine installed & first project opened	
2-6	Programming foundations: variables, events, loops, conditionals, input	First moving, controllable character	
7-11	Core mechanics: collision, scoring, win/lose states, simple UI	Small playable prototype	
12-15	Game feel & polish: audio, basic animation, level structure	Semester 1 capstone: complete Mini-Game	
16-20	Intermediate systems: state machines, enemy/AI behavior, physics	Prototype with opponents/obstacles	
21-25	Expanding scope: menus, save data, multiple levels, juice/polish	Feature-complete draft of capstone game	
26-28	Playtesting, bug-fixing, presentation prep	Playtested, stable build	
29-30	Finalize, package, and export shareable copies	Shareable build ready for CoOp Expo	

Semester 1 Capstone (Lessons 12-15)

By the end of Lesson 15, your game should be a complete Mini-Game: it has a clear core mechanic, art and audio (even simple/placeholder), and reaches a real win or lose state. This is the same project you started in Lesson 2 - it's been growing the whole time.

My plan for reaching the Semester 1 capstone

Semester 2 / CoOp Expo Capstone (Lessons 26-30)

The final weeks of Semester 2 shift from new material to finishing, playtesting, and packaging your game so it can be demonstrated at the co-op's Expo and shared with friends and classmates. You'll export a runnable build (or shareable link, for browser-based engines) and prepare a short demo/pitch, with structured playtesting feedback from classmates before the Expo.

My plan for the CoOp Expo

The Five Disciplines of Game Development

Every game (including yours) touches all five of these, even on a small student project. Programming is our main focus in class, but the other four matter too - use the space under each to jot ideas as they come to you.

Design

Deciding what the game is and how it plays - the rules, the goals, the feel.

YOUR NOTES

Programming

Making the rules and mechanics actually work in code (our main focus this year).

YOUR NOTES

Visual Art

Characters, environments, and UI - what the player sees.

YOUR NOTES

Audio

Music and sound effects - what the player hears.

YOUR NOTES

Production

Planning, scoping, and finishing a project - relevant all year, critical before the Expo.

YOUR NOTES

Design Journal / Change Log

A quick running log of significant changes to your game and why you made them - useful for remembering your own reasoning later, and required reading for yourself before the Semester 1 and Expo capstones.

Date	Lesson #	What changed and why
